Salary

Do you spend a lot of administration on calculating salaries and preparing payroll?

With the Microbizz Salary Module, all data for payroll can be prepared automatically based on real time registrations in Microbizz of data such as time, overtime, supplements, expenses and transportation.

Many collective agreements handle a lot of different salary types and supplements, and so it is required that a calculation is made on each employee's registrations for the right salary calculation.

This is a cumbersome process if handled manually. With the Microbizz Salary module, the process is automated.

- Avoid manual calculations of each employee's time every single month
- Let a system calculate wages so as to avoid human errors in calculations
- · Assure that the process is structured and runs according to contracts and agreements

Functionality

- Convertion of time and expenses to payroll codes that can be imported into a payroll program
- Calculation of overtime based on standard time for the individual user
- Calculation of surcharges based on task fields and added items
- Salary models are created which are assigned to users, depending on how they are to be settled contractually in connection with salary payment
- Payroll codes are created to which all registrations are converted
- Rules are set up for the individual salary code for each salary model, so that different calculation options can be set up depending on how the salary is calculated
- Salary can then be saved as a csv file formatted for your salary system
